

LL GRAMMARS

LL grammars are a subset of BNF (context-free) grammars. **LL** grammars impose restrictions on BNF grammars to simplify parsing. **LL** grammars may be implemented in top-down predictive parsing algorithms with complexity $O(n)$, where n is the length of the input string. This includes both recursive-descent and table-driven algorithms based on syntax graphs. **LL** parsers operate by scanning the input from **Left** to right and producing a **Leftmost** derivation of the input string.

The conditions for an **LL** grammar are stated in terms of the **FIRST** and **FOLLOW** sets applied to the grammar rules:

1. If $\langle X \rangle = \langle V_1 \rangle \mid \langle V_2 \rangle \mid \dots \mid \langle V_n \rangle$, then $\text{FIRST}(V_i) \cap \text{FIRST}(V_j) = \emptyset$, $i \neq j$.
2. If $\langle Z \rangle = \{ X \}^*$ (zero or more X 's), $\text{FIRST}(X) \cap \text{FOLLOW}(Z) = \emptyset$.
3. No left recursion is allowed.

Briefly, $\text{FIRST}(X)$ is the set of all terminals which can appear at the start of a string derived from X . $\text{FOLLOW}(Z)$ is the union of $\text{FIRST}(V)$ for all grammar rules of the form: $X \rightarrow ZV$. In case $X \rightarrow Z$, $\text{FOLLOW}(Z) = \text{FOLLOW}(X)$.

Example 3.1: Modified for LL Grammar

The **FIRST** condition for an **LL** grammar is violated by the RHS rules in Example 3.1 for $\langle \text{stmt_list} \rangle$ and $\langle \text{expression} \rangle$. An **LL** grammar can be obtained by left-factoring these rules and converting the right recursion in $\langle \text{stmt_list} \rangle$ to repetition. Using EBNF, the modified rules are:

```
 $\langle \text{stmt\_list} \rangle = \langle \text{stmt} \rangle \{ ; \langle \text{stmt} \rangle \}$   
 $\langle \text{expression} \rangle = \langle \text{var} \rangle [ ( + \mid - ) \langle \text{var} \rangle ]$ 
```
